

# Yamaha Raptor 700 Front Lowering Kit

Part Number 20-1070

Note: Make sure you have received a complete kit. The picture (top left) shows all the parts and how they go together.

1) Raise the front end of the quad so the front wheels are off the ground.

Remove upper shock mount bolt.

2) Remove the upper shock bolts on both sides and swing the shock away from mounting bracket.

3) Install the lowering kit bracket and bushings in the original shock mounting holes using the stock nut and bolt. The ears of the bracket should be pointing up. The picture on the right shows proper orientation.

4) Be sure to position the lowering bracket against the front of the shock mount bracket and bushings against the back. Do not tighten the bolts at this time. 5) Re-install the shock in the desired mounting holes using the supplied hardware. 6) Lower the bike, tighten all bolts and check the suspension for binding.

*Note: Due to manufacturing variances, it may be necessary to bore the bracket mounting holes for proper fit.*

This is how your lowering kit should look when you're done! ► Bounce front up & down, check for binding!
